Actions/cache - Fan in from matrix jobs #26665

 **nyarly** on May 18, 2022 · 1 comments · 1 reply

The shards are straightforward: I have a setup job that produces a matrix JSON, and then the individual builds are run in a strategy.

I've been trying to set up `actions/cache@v3` to store the build products and then pull them into the merge job. I'm currently doing something like `with: key: ${{ runner.os }}-cue-${{ hashFiles('**/*.cue') }}-${{ matrix.shard }}` in the builds, and then separate steps in the merge job, where the shard number is hard coded.

I have two problems:

1. The merge job doesn't see the cache from the matrix build jobs. This especially problematic because it's impeding me sharing the output files of one job with successors.
2. I have to hard-code the cache steps; I'm hoping that I don't need to write my own "multi-cache" job to be able to feed the matrix into and fetch everything, but that's the conclusion I'm coming to.
